“My most profitable device at this time is the Aerolase LightPod Neo,” said Michael Gold, M.D., a dermatologist in Nashville, Tenn. “I highly recommend this system for patients who have been unsuccessful with medications and are seeking technology as an alternative. I have a large acne population and use this device all day to treat these patients painlessly and successfully. It can be used for a number of applications, but for us, acne is number one.”

Compared to other laser devices on the market, Dr. Gold’s opinion is that the LightPod Neo solves a number of unmet needs in the aesthetic industry. “This device is a workhorse that addresses a range of conditions that patients want treated — and does so successfully in a highly tolerable procedure,” he stated. “Plus, the device is very affordable and operates without any per-treatment costs. It’s compact and portable, which is great for small offices or multiple locations. It checks off all the boxes of what an aesthetic office needs to be successful and profitable. It may sound too good to be true, but the bottom line is that Aerolase has provided us with an amazing device that works.”

According to David Goldberg, M.D., J.D., a dermatologist in New York, N.Y., “The LightPod Neo system is a brand new, revolutionary laser. The 650 µs pulse allows us to bring the 1064 nm laser to new levels of safety and efficacy — even on the face for all skin types. In our study for facial telangiectases, we observed great outcomes and absolutely no complications.”

“What is really exciting about this laser is it is truly safe for any skin type. We can perform rejuvenation for the face, neck and décolletage on everyone,” said Jason Emer, M.D., a cosmetic surgeon in Beverly Hills, Calif. “This laser is attracted to hemoglobin, pigment and water, so we achieve a truly comprehensive rejuvenation treatment to clear skin, tighten and give it better overall quality. There is nothing else like it on the market.”

Cheryl Burgess, M.D., a dermatologist in Washington, D.C. agreed with Dr. Emer’s findings. “The LightPod Neo works amazingly for rejuvenating facial skin. I regularly use this laser in conjunction with chemical peels, neurotoxin and fillers in one session because of its gentle pulse. It also works remarkably for clearing melasma in my darker skinned patients. The LightPod Neo has quickly become our ‘go-to’ aesthetic device.”

Aerolase (Tarrytown, N.Y.) is taking complete skin rejuvenation treatments to the next level with a laser platform based upon new 650 microsecond (µs) pulse technology. Using a multi-treatment approach with a single device and handpiece, the LightPod Neo delivers quick, consistent results for a number of indications including severe and cystic acne, neocollagenesis, veins, melasma, rosacea and more, all within a uniquely comfortable patient experience without cooling or anesthetic for all ages and skin types — including tanned skin. Whether used to address a single patient concern or multiple indications in just one treatment session, the LightPod Neo is quickly becoming a favorite device among patients and practitioners.
Aerolase® Lasers
Clearing Acne Other Devices or Drugs Can’t

Aerolase 650-microsecond laser technology offers a new approach for highly effective, long-lasting results for treating active acne including cystic acne, acne on the torso and acne in skin of color. This new treatment option offers an effective approach for patients who have not been able to use or have not responded to systemic therapies.

“The LightPod Neo is the most profitable device in my practice right now. I treat 15 to 20 patients per day, even on cystic acne and teen cases. Results are immediate unlike systemic therapies, which can take 60 to 90 days. This device is a ‘game changer’ for acne.” Michael Gold, MD, Dermatologist
